SUMMARY

B.Tech in Electrical Engineering, IIT Kharagpur (CGPA 8.14/10), 2024. Backend and cloud engineer, 3.5+ years on a multi-tenant, event-driven SaaS platform on AWS serverless — 60+ microservices, 75+ customer tenants, regulated data. I take customers live on third-party integrations and run them in production, working AI-DLC style: the AI drafts and executes, I design, gate and verify.

HOW I WORK WITH AI (AI-DLC)

AI-DLC in practice: I set intent and constraints; the AI drafts the plan, design and tests; I gate each step; the AI executes in bounded units; nothing merges without passing tests and a production-data check. Architecture, data and API design and every production call stay with me; sweeps, scaffolding and first drafts go to the AI. I wrote the team's AI review checklist.

EXPERIENCE

Alpha Nodus — Software Development Engineer II

Jan 2026 – Present

Backend Systems & Architecture

Bengaluru, India

Service Agents: Designed and led the platform's service-agents toolkit — any service can run a long-lived agent with checkpointed threads and human-in-the-loop interrupts (pause for approval, resume by API). Four agents run on it: support, order and document chat, and scheduled log triage.

Outbound Event Delivery System: Designed and built the event fan-out layer that delivers domain events to customers' systems with per-entity ordering, retry tracking and a declarative routing DSL; a single large tenant pushes **250K+ events a month** through it.

Third-Party Integration Platform: Owned the integration codebase for **45+ tenants** across five vendor platforms — per-tenant serverless stacks from one codebase, reusable templates, a shared handler package; stood up 6 new customer integrations in 2026 and took them live.

Tenant Cloner: Built, in two weeks, a hosted service that clones a production tenant's configuration through the public API — idempotent, resumable runs, KMS-encrypted short-lived credentials, dual-control approval for prod→prod.

Alpha Nodus — Software Development Engineer I

Nov 2022 – Dec 2025

Backend Systems (intern until Apr 2023, promoted in six months)

Bengaluru, India

Pricing & Estimation Engine: Owned the cost-estimation service — contract pricing, multi-party benefit coordination, overrides — raising customer collections from **5% to 30%**; **877K+ estimates** at the largest customer alone.

Partner API Connector (X12 EDI): Built the connector to an external approval system — EDI ↔ JSON ↔ FHIR, status polling, webhooks — cutting turnaround from **2–24 hours to under 8 seconds**.

LLM Pipelines: Built the AI task layer (Textextract + Claude + Step Functions) that turns unstructured documents into completed downstream actions in **~30 s**, behind schema-validated outputs with retry and fallback — **~15K documents a month** at the largest customer.

Customer Integrations & Automation: Built the first 25+ customer integrations over vendor APIs and HL7 via Mirth Connect, plus the shared libraries; built the auto-assignment service (round-robin) and the n8n workflow integration.

Platform & Reliability (AWS): Aurora read replicas for **3.75M API calls/hour**; Redis cache cutting DB reads 80%; zero-downtime UUID → sequential-ID migration; anomaly alarms that cut incident response 60%.

PROJECTS

AI Agent Tooling (Claude Code plugins, MCP): Built the team's PR-review agent that enforces the backend checklist on every pull request, and a multi-agent investigation plugin over CloudWatch, the codebase and support tickets with tenant-scoped, read-only guardrails.

Self-hosted Workflow Automation (n8n on AWS ECS): Queue-mode deployment behind an ALB with Redis as the job queue, so workers scale horizontally while the main node keeps authoritative workflow state.

Embeddable Widget Platform: Multi-tenant document-upload and patient-portal widgets installed by a generated script tag — per-tenant allowed origins and theming, served from CloudFront + S3 behind origin access policies and Lambda@Edge, with zero-touch CI/CD deployments.

TECHNICAL

AWS: Lambda, SQS / SNS, Step Functions, EventBridge, DynamoDB, Aurora PostgreSQL, S3, KMS, Cognito, CloudWatch, Glue, SES, CloudFront, Lambda@Edge, ECS · **IaC & CI/CD:** CDK, Serverless Framework, CodePipeline, GitHub Actions · **Languages & APIs:** TypeScript, Node.js, Python, SQL, GraphQL, REST, React, Next.js · **Data & messaging:** PostgreSQL, Redis, event-driven architecture, CQRS, multi-tenancy · **AI:** Claude API, MCP, agents toolkit, n8n · **Testing:** Jest, Playwright · **Integration protocols:** HL7, FHIR, X12 EDI, Mirth Connect
